Given a group, returns a poset with an internal representation as a list of faces ordered by rank, where each face is represented as a list of the flags it contains. Note that this function does not include the minimal (empty) face nor the maximal face of the maniplex. Returns: *IsPosetOfFlags* with *IsFull=true*.

Returns a full poset corresponding to the connection group *g* with an internal representation as a list of faces ordered by rank, where each face is represented as a list of the flags it contains. This function does include the minimal (empty) face nor the maximal face of the maniplex, so the list has *n* + 2 ranks if the maniplex is of rank *n*. Returns: *IsPosetOfFlags*

Given a maniplex, returns a poset of the maniplex with an internal representation as a list of faces ordered by rank, where each face is represented as a list of the flags it contains. Note that this function does not include the minimal (empty) face nor the maximal face of the maniplex. Note that adjacencies are listed from ranks 0 to one less than the dimension. You can replace *flag* with the integer corresponding to that flag. Appending *true* to the arguments will give the position of the flag instead of its description from *FlagsAsListOfFaces-FromPoset*.
